Abstract

https://lamortadella.github.io/BPRPlibraries/index.html.

Key words: stars: evolution — stars: supergiants — stars: massive

1 Introduction

2 XSP and Gaia BP/RP

The work of Verro et al. (2022) delivers a list of 830 spectra, which are freely available on Vizier. A list with 807 matches (2arcsec radius) between the XSP spectra and Gaia DR3 data points was used xsl_dr3_xmatch_GaiaEDR3_xmatch_GaiaDist_KV_2asec_pure.csv.

The used table contains five entries for which no spectra are available in the tar file, and that are listed in Table 2; in other words these five entries are not included in the list of 830 published spectra (full table retrieved via Vizier).

A best quality list of 449 spectra was also received from Verro et al. with 447 belonging to the table xsl_dr3_xmatch_GaiaEDR3_xmatch_GaiaDist_KV_2asec_pure.csv. When crossmatching the Best XSP spectra with the table gaiadr3.astrophysical_parameters 447 entries (all) are found. The matches with has_xp_continuous=1 are 345. When considering the repeated XSP observations, the 345 matched corresponds to 292 stars.

In the github webpage https://lamortadella.github.io/BPRPlibraries/index.html, there is a display page with the original XSP spectra (cyan) and overlaid the Gaia BP/RP spectra (black). A rebinned and shifted version of the XSP spectra is created (red curve) to match the resolution and wavelength scale of the Gaia data – note that the accuracy of the latter can be improved removing the shifting and adding proper summation...

In Table 3, the 345 XSP spectra Ids and associated Gaia-DR3 Ids are listed. chiT is a measure of the quality of the spectral match and is defined as: chiT=$\sum \frac{flux(XSL)-flux(BPRP)}{flux(BPRP)}$. The Table 3 also lists a "factor" which is simply the ratio of the average flux(BP/RP) and average Flux(XSL) between 700 and 750 nm. In Fig. 6, the histogram of the chiT values is seen to peak at 7.7. In Figs. 7 and 8, the chiT values are plotted versus the G-mag and the BP-RP color.

All sources with a BP/RP spectrum have more than 15 observations in BP and RP bands (Figs. 4 and 5).

inserire il controllo di variabilita'

3 UVES_POP

For the UVES_POP spectra, Names, coordinates, and Gaia IDs were read from the fits header. The reported Gaia IDs were a mix of Gaia DR2 IDs and Gaia DR3 IDs. The annotated target coordinates were up to 2″ off. By using the Names (mostly HD-names) coordinates were retrieved from Simbad. By cross-correlations, 2MASS-IDs, Gaia DR3 and Gaia DR2 IDs were re-retrieved. A few new matches were located, as listed in Table 4. The other matches were all fine (beside the DR2 and DR3 ambiguity).

3.1 UVES_POP Gaia BP/RP

There are 406 fits available in the UVES_POP library (Borisov et al. 2022). 365 have a Gaia DR3 match and 294 Gaia DR3 matches with has_xp_continuous=1 are found in the table gaiadr3.astrophysical_parameters. A number of 294 BP/RP mean spectra in the continuous representation could be retrieved and resampled.

UVES_POP spectra are resampled to the Gaia BP/RP resolution, and compared with the Gaia BP/RP spectra. A ChiT parameter is calculated as the sum(abs(Flux(UVES_POP)-Flux(BPRP))/Flux(BPRP)). The histogram of the obtained ChiT is shown in Fig. 1. It results the 99 stars are suitable for a calibration study (ChiT < max(chiT)=7.69). Only 30 stars have a ChiT smaller than five.

missing variability crosscorrelation, are the 99 non variable.
